

AI Investment Advisor Deployment Guide

Step-by-Step Setup for Localhost Demo

Phase 1: Environment Preparation

On your organization's laptop, ensure the "Engine" is ready.

1. Install Python

- Download **Python 3.11 or 3.12** from python.org.
- **MANDATORY:** Check the box **"Add Python to PATH"** during installation.

Phase 2: Folder Structure & Files

You must recreate the exact folder structure so Streamlit can find your secrets.

1. Create the Main Folder

Create a folder anywhere (e.g., `Documents\AI_Advisor`).

2. Placement of app.py

Put your `app.py` directly inside that main folder.

Location: `AI_Advisor pp.py`

3. Placement of secrets.toml (The "Hidden" Folder)

- Inside `AI_Advisor` , create a new folder named `.streamlit` (include the dot).
- Put your `secrets.toml` inside that folder.

Location: `AI_Advisor\.streamlit\secrets.toml`

Phase 3: Command Prompt (CMD) Setup

Open CMD and run these commands in sequence.

1. Navigate to the Folder

```
cd Documents\AI_Advisor
```

2. Install Requirements

Run this line once to install all necessary tools:

```
pip install streamlit groq yfinance pandas
```

Phase 4: Running the App

Whenever you are ready to present, use this command:

```
python -m streamlit run app.py
```

Final Checklist for Success:

- **Secrets Format:** Ensure `secrets.toml` contains `GROQ_API_KEY = "your_key_here"`
- **Dot Folder:** Verify the folder is `.streamlit` (dot at start), NOT just `streamlit`.
- **Working Directory:** Always `cd` into the folder in CMD before running the `python -m streamlit` command.
